## Launch of the SSCV-Safety service Safe transportation management for a zero-accident society

On July 12, 2021, as part of our SSCV (Smart & Safety Connected Vehicle) digital platform for transportation, Hitachi Transport System, Ltd. launched SSCV-Safety, which is a new service providing total support for safe transportation management.

### What is SSCV?

SSCV is our digital platform for transportation that aims to support transportation and improve society by solving transportation issues through the combination of a logistics business viewpoint with the power of technology. It consists of three solutions: SSCV-Smart, SSCV-Safety and SSCV-Vehicle.

SSCV-Safety is a safe operation driving management solution that prevents accidents caused by absent-minded driving by visualizing "fatigue" and "stress" that the drivers may not even aware of. SSCV-Safety combines proprietary accident risk prediction algorithms and technologies. AI analyzes data such as drivers' biometric data before and after their operations and during operations, and the driving data acquired from the drive recorder and vehicle behaviors.

We will increase the utility value to solve social issues such as strengthening the safety management of drivers held by transportation companies and improving the work environment by expanding cooperation with "SSCV-Smart," which has already started service, and "SSCV-Vehicle," which is scheduled to release in the future.
